

**CEILING CONCEALED
TYPE FAN COIL UNIT**

RUIDONG GROUP

www.ruidonggroup.com.

Ruidong Group Co., Ltd is one modern large-scale enterprise integrating design, production, sales and installation of central air-conditioning products.

Ruidong is located in Dezhou City, Shandong Province. The Beijing-Shanghai High-speed Railway and Beijing-Shanghai Expressway passing through the city, make Dezhou become a key coordinate of the national economic artery. The registered capital of the group is one hundred fifty five and a half million yuan, covering an area of 300,000 square meters and construction area of 180,000 square meters.

Main business coverage:

1. Host series:

- Water cooled series: centrifugal cold (hot) water unit, screw type cold water unit, screw type water (ground) source cooling and heating unit, scroll type water (ground) source cooling and heating unit.
- Air cooled series: screw type cold (hot) water unit, modular type cold (hot) water unit, mini type cold (hot) water unit, VRV series unit.
- Packaged Unitary unit: constant temperature and humidity unit, air (water) cooled unitary unit, dehumidification unit.

2. Direct expansion series: Rooftop packaged unit, ducted split unit.

3. Terminal series: Purification air handling unit, combined air handling unit, fresh air unit, fan coil unit series.

ENTERPRISE PROFILE

4. **Ventilation series:** Fire exhaust fan, roof fan, axial fan, diagonal fan, centrifugal fan, etc.
5. **Engine room equipment:** cyclone sand remover, water separator (separator), decontamination device, demineralized water device, plate heat exchange unit, constant pressure equipment, etc.
6. **Air conditioning accessories:** All kinds of fire valves, regulating valves, tuyere series.
7. **Other products:** Low-temperature industrial chillers, air-conditioning equipment for planting and breeding industries.

The R & D team composed of high-tech talents will continue to introduce new products, advanced production equipment and adopt the international ISO9001 quality management system as a strong guarantee for product quality. Precision testing equipment and rigorous testing methods are the fundamental insurance of quality and are timely and thoughtful. After-sales service solves the problems that may arise in use for you.

The company has established a complete sales and service system. Set up offices in 18 cities including Beijing, Tianjin, Shanghai, Xi'an, Shenyang, Chengdu and other cities to provide users with timely, efficient and high-quality pre-sales, sales and after-sales services.

Ruidong Air Conditioning wishes you: Cooling air for propitious summer, spring returns with warm air from Ruidong.

CERTIFICATIONS

Ruidong group always takes "create first-class quality, offer sincere service" as the quality concept, builds customer-oriented quality management system, focuses on teamwork and insists on continuous innovation.

Ruidong water fan coil unit

RFP series standard fan coil unit can be widely used in hotels, restaurants, factories, hospitals, shopping malls and other places.

It integrates advanced low-noise fan manufacturing technology, air-conditioning product manufacturing process, and the newly developed advanced fin shape. It is a new generation of ultra-low noise, ultra-high efficiency, and re-development based on the original fan coil design A convenient and compact structure replacement product, the unit has the following characteristics:

Ultra low noise:

The unit adopts the newly designed low-speed forward multi-wing wide impeller, which is optimally matched with the motor, and has good thermal insulation and muffler materials, so that the noise of the unit is generally reduced by 2 ~ 5dB (A) to the best level compared with similar units. Imported low-noise rolling bearings, no need to add lubricating oil, the design life is more than 12 years.

High efficiency:

The heat exchange coil adopts the newly developed fin form combined with the secondary flanging structure. Through the advanced mechanical tube expansion process, the copper tube and the aluminum foil are in close contact. The new fin provides an ideal heat flow channel for full heat exchange. The impeller provides a uniform heat transfer air speed environment for the coil, which makes the heat transfer efficiency higher and the heat transfer more sufficient, so that the unit input power and unit cooling capacity of the unit coil in the case of two rows meets or exceeds that of the industry level.

Ultra-thin body:

The height of the unit is only 230mm, which can save more installation space than similar coils and fully meet the installation requirements of various occasions.

Various options:

The design fully considers the particularity of the installation site and the site constraints, and the unit can provide drain pan of different lengths for customers to choose.

Standard drain pan--specially designed for narrow spaces, which can reduce the required installation position, suitable for places with limited installation space.

Extended drain pan--can more effectively accept valve leakage and condensate.

Stainless steel drain pan--According to special anti-corrosion requirements, stainless steel drain pan can be selected.

Silent operation

The use of new environmentally friendly sound-absorbing glass fiber insulation materials can not only ensure a smooth and beautiful appearance, but even under severe condensation conditions, the insulation performance of the unit can meet the requirements of international standards.

Optional wet film humidification:

Use the natural evaporation of water for humidification, combined with the surface cooler, save the length of the unit, and the air enthalpy change.

Equipment structure / material description

The motor drives the centrifugal fan through the rotating shaft and is assembled on the back panel of the heat exchanger.

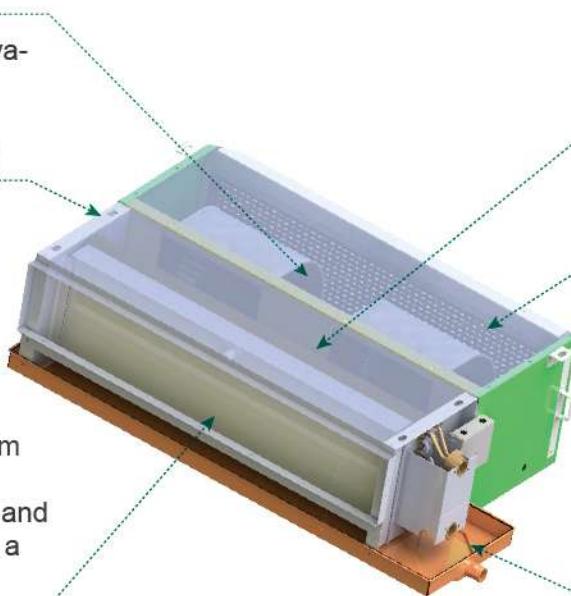

All sheet metal is galvanized steel, and the insulation material is self-extinguishing PE.

The addition of wet film humidification can facilitate temperature and humidity regulation in a single space.

The coil is made of copper tube and aluminum coil fin structure. It adopts mechanical expansion method to ensure efficient heat exchange, and is expanded and integrated into the end plates on both sides of the coil.

Can select usual nylon filter or aluminum filter.

Equipped with lifting holes, which can be easily installed on site. The chilled water inlet and outlet pipes, condensate pipes and junction box are located on the same side of the unit.

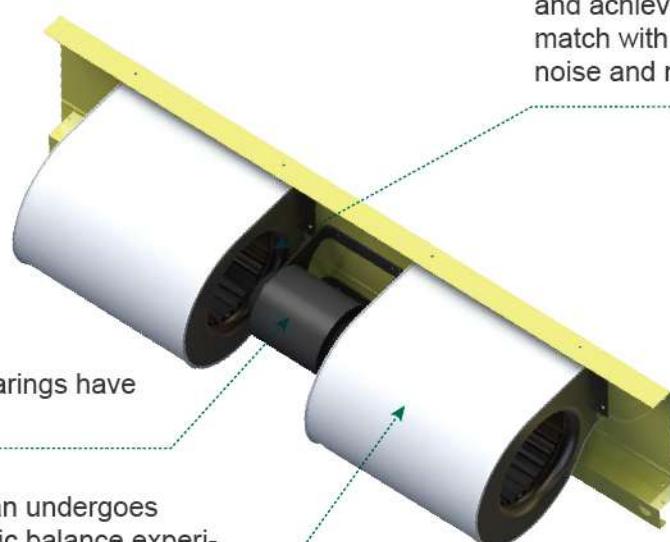

Description of fan and motor

The noise of the unit under rated operating conditions complies with national standards, and the selected motors have passed the national 3C certification.

The fan adopts the newly designed low-speed forward multi-wing wide impeller, and achieves the best match with the motor, low noise and no static dust.

Sealed motor bearings have long service life.

The centrifugal fan undergoes dynamic and static balance experiments before leaving the factory.

Pipe connection direction determine:

Face the front air outlet to distinguish the left and right direction of the unit. If the water inlet pipe of is in the left hand direction, it is called the left type, and the reverse is the right type.

Standard unit:

- ESP: 12Pa, 30Pa, 50Pa
- Standard drain pan: galvanized plate with powder coating
- AC motor
- Without plenum box
- without air filter

Fan type		Forward multi-wing centrifugal double suction fan								
Motor type		Brushless DC motor								
Coil	Rows	3								
	Pressure	Design pressure 1.6MPa, test pressure 2.5MPa								
Pipe size	Water pipe	R3/4 (internal thread)								
	Drain pipe	R3/4 (external thread)								
Net weight	(kg)	13.4	14.9	16.9	18.2	19.5	26.9	29.5	33.6	39.5
Optional accessories		Thermostat, 2-way / 3-way valve, return box								

- Note:**
1. Cooling: inlet/outlet water temperature 7 °C / 12 °C, inlet air DB27.0 °C, WB19.5 °C.
 2. Heating: inlet/outlet water temperature 60 °C / 50 °C, inlet air DB21.0 °C.
 3. The noise in the table is measured by the unit in a totally anechoic room with a background noise of 16.5dB (A).
 4. The static pressure at the outlet of the low static pressure unit with air outlet and filter is 0Pa; the static pressure at the outlet without air outlet and filter is 12Pa.
 5. The power consumed by the motor load is the input power (also referred to as reference operating condition consumption), the power on the motor nameplate indicates the nominal power, that is, the output power of the motor when it is running at rated operating conditions.
 6. If the actual operating conditions are different from the standard operating conditions, please refer to the correction coefficient table data to correct it. Correction method: actual cooling (heating) amount = rated cooling (heating) amount × working condition correction factor.

MEDIUM&HIGH STATIC PRESSURE DUCT TYPE FAN COIL UNIT

(1) Brief Introduction

RFP X XXX - X XX

Omit:220V-1PH-50HZ
A: 220V-1PH-60HZ
B: 110V~120V-1PH-60HZ

L:Left

R:Right

-B:2 pipes 3 rows
-C:2 pipes 4 rows
-D:4 pipes 3+1 rows

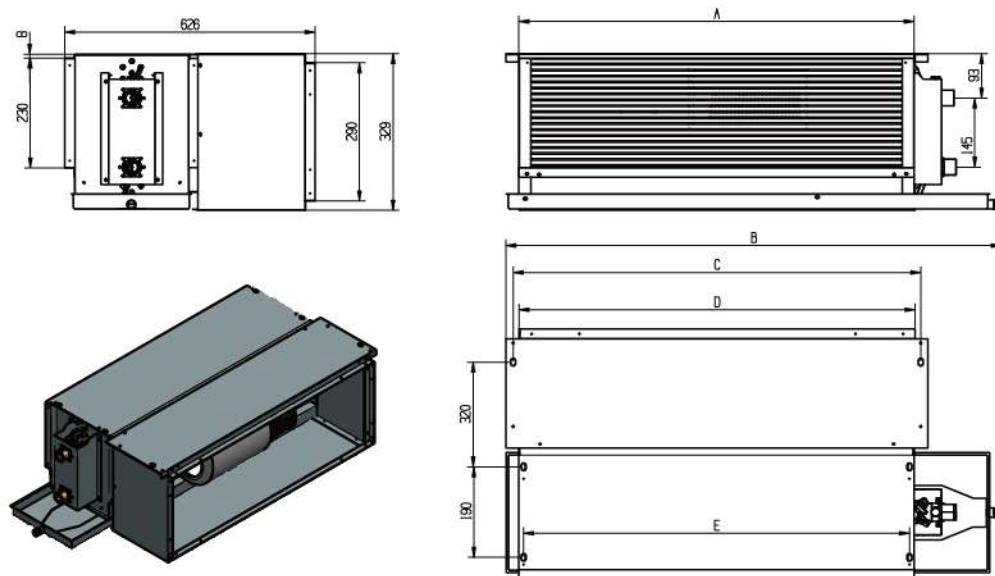

Air flow x 10m³/h

M: Medium static pressure-100pa
H: High static pressure pressure-150pa

Ruidong water fan coil unit

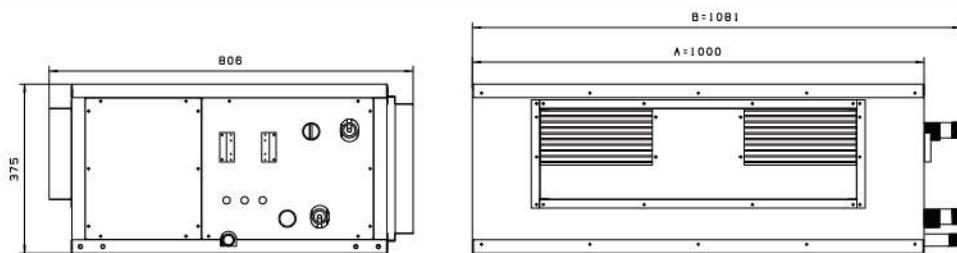

- Classical elegant design.
No-spangle galvanized sheet, beautiful appearance.
- High static pressure, long distance air supply.
The static pressure is max. 100pa to 150pa.
- Big diameter fan, big air volume, low noise.
- E-heater is optional.

Note: 1.Tesing:esp:150pa.
 2.Cooling: Air inlet (DB) 27°C,(WB)19.5°C.Water inlet 7°C,water outlet 12°C
 3.Heating: Air inlet (DB) 21°C.Water inlet 60°C, water flow same as cooling condition

3. INSTALLATION REQUIREMENTS

- Professionals are required for installation, wiring and maintenance, otherwise it may cause motor burnout, water leakage, electric shock or fire.
- The unit should be installed on the basis of sufficient load-bearing capacity, otherwise it may cause personal injury after loosening.
- During the installation process, it is strictly prohibited to handle the volute and the impeller handling unit, and it is strictly prohibited to hoist the hand-held motor. The volute of the fan must not be impacted to avoid deformation of the volute and friction or noise during the operation of the fan.
- For a horizontally installed unit, the four lifting points must be ensured that the unit is at a level during installation to prevent the condensate pipe from being higher than the condensate tray to cause condensate outflow to cause overflow.
- The concealed unit must be provided with an access door at the installation location for daily maintenance.
- An air filter must be installed in the air system to prevent dust from adsorbing on the surface of the heat exchanger for a long time and causing the heat exchanger to fail.
- The inlet and outlet pipes of the unit must be equipped with valves to facilitate the shut-off of the water system during adjustment and maintenance. The unit can only bear its own weight and cannot bear the water pipe and other external forces. When connecting the water pipe to the unit, rubber or metal hoses should be used. The inlet of the unit must be installed with a filter no larger than 16 mesh, and pay attention to the cleanliness of the inlet and outlet pipes.
- Do not use excessive force when connecting pipelines to avoid water leakage due to coil damage.
- After installation, be sure to remove all debris left in the condensate box during installation to ensure that the condensate drain channel is clear.
- Connect the wires strictly according to the electrical schematic diagram, and confirm that the third gear test runs normally.
- Unit power supply: single 220V-50HZ, the unit needs to be reliably grounded to prevent fire or personal injury caused by electrical leakage. When it is difficult to start the unit, please check whether the power supply voltage is normal and whether the wind wheel is in contact with the volute.
- After the power is turned on, the fan should be started to observe whether the rotation direction is correct.
- When the speed control switch of the unit is turned on, it should be started from the high grade, and then select other grades. When a switch is responsible for the sharing of multiple units, it must be noted that the speed of each unit should be the same.
- The temperature of the cold water supply of the unit in summer should not be lower than 6 °C, and the temperature of the hot water supply in winter should not be higher than 80 °C. The cold and hot water used must consider the local water quality and be softened if necessary.
- The unit is allowed to use the maximum pressure of 1.6MPa.

4. MAINTENANCE

- When re-inspecting or repairing the fan coil unit, to ensure safety, be sure to cut off the power supply.
- The air filter should be cleaned regularly to avoid affecting the journey.
- When the motor runs normally, but the indoor effect is poor, first check whether the air volume at the air outlet is sufficient. If the air volume is insufficient, the air filter is generally blocked.
- When the temperature difference between the inlet and outlet water is large, the water filter is generally clogged. Please clean the corresponding filter according to different situations.
- Finned heat exchangers should be regularly inspected and cleaned to keep them clean and ensure good heat transfer.
- When the unit is stopped for long time, the pipe should be filled with water or other methods should be used to reduce the corrosion of the pipe. When used in winter, the water in the pipe must be drained. If some of the water in the horizontal unit cannot be exhausted, antifreeze can be added to the water to prevent the copper tube from freezing and cracking.

5. ORDERING INSTRUCTIONS

- When selecting fan coil unit, please specify specifications, model, and the direction of the inlet and outlet pipes.
- When selecting the horizontal fan coil unit with air return box, please indicate the return air position.
- Please indicate the static pressure at the outlet of the unit, the standard type is 12Pa, and the medium static pressure is divided into 30Pa and 50Pa. If there is no special requirement, it will be supplied according to standard static pressure type.
- If you need extended drain pan, please specify in advance. If there is no special requirement, it will be supplied according to standard static pressure type.
- If you have other needs, please consult the salesman in advance.

TESTING CENTER

Testing center covers an area of 6500 square meters; total investment of 50 million RMB, is the largest and most complete detection device in the north of China , the testing range is from house-hold air conditioner to the centrifuge chillers.

Testing center adopt internationally renowned brand measuring instruments, including the United States Agilent data acquisition, Japan Yokogawa power meter, Saibi Ling platinum thermal resistance, to ensure the test accuracy.

Testing center can test multi-unit, air-cooled unit, fan coil unit, ceiling air handling unit, modular air handling unit,purifyiing air conditioning unit, water loop heat unit, air-cooled module chiller and air-cooled screw chiller.

MAIN PROJECTS

High school building in Brazil

Presidential palace of Kazakhstan

Shanxi Dingxiang County People's Court

Shanxi Yuncheng odd Star Technology Co., Ltd

Beijing Grand Oriental Hotel

Shanxi Linfen High Speed Rail Station

Beijing Sihui building materials city

Shanxi Tongmei Group Zhangze Power Puzhou Power Generation Branch
